Hypothesizing and Evaluating GenAl in Your Newsroom

SRCCON 2023

(aka:

My boss thinks Al is cool. What do I do now?)

Who we are

Eric UlkenVice president of product,
The Baltimore Banner

Building sustainable business models for local news through technology

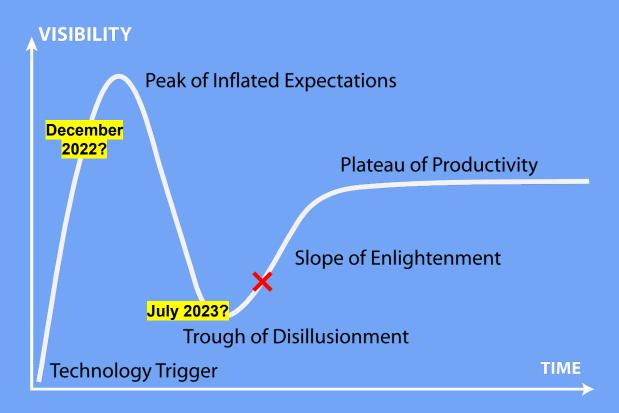

Sachita Nishal
4th year PhD student @ Northwestern
Communications & Computer Science

Designing and studying AI tools to support journalists

Goals for this session

- Develop testable hypotheses around Al use cases
- Consider human factors of interacting with these tools
- Determine which applications are ripe for pursuit

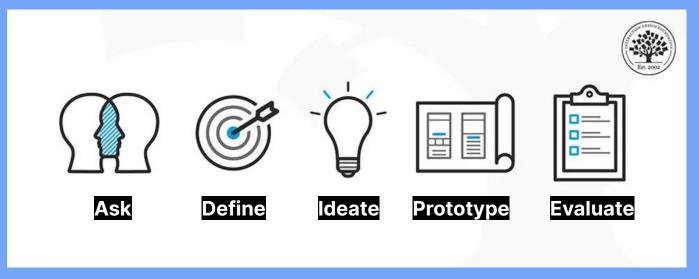

Where are we on the hype cycle?

"How can we use GenAl for something useful?"

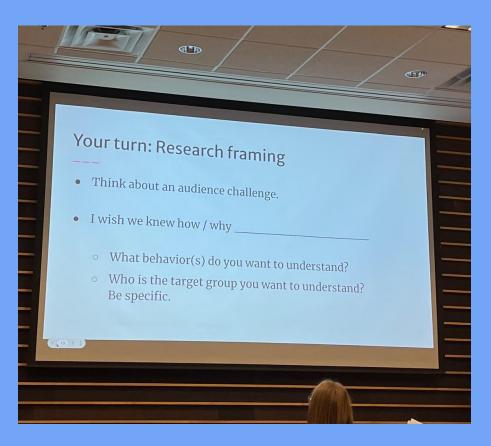

This has felt like a bit of a strange question to ask over the past year ...

How we generally do this: human-centered design

How we generally do this: human-centered design

Why generative AI feels different

Understand what the technology **is** and what it's **not**

Generate **hypotheses** about use cases + **choose** practical ones!

Have a clear **evaluation** strategy for each hypothesis

Let's do a group exercise ...

Grab some scratch paper, or you can use the session doc Pick a task! And let's generate some **hypotheses!**

We will also use a sample case to walk through the example

Categories/examples of use cases for Al in news

Newsgathering

- →Surfacing leads from structured or unstructured text
- →Generating news angles
- →Summarize/QA dense data
- → Transcription

Production

- →Writing summaries of stories
- →Editing partner
- → Retrieve archive data that might be relevant

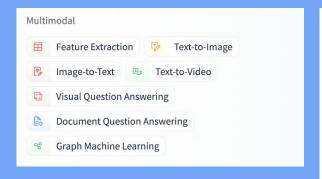

Dissemination

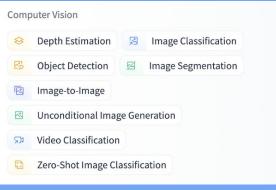

- →Summaries for social media or SEO
- → Personalize/localize studies
- →Alt text

Collaboration and Coordination

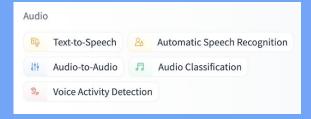

- →Summarize meeting minutes
- →Deliver targeted analytics insights

Ways to do this

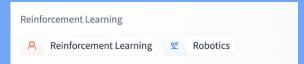

Source: <u>Hugging Face</u> tasks taxonomy

What **task** would it be used for?

→Specificity of task? General purpose use? More customizable?

What is the **goal** for this task?

- →Supplement activity (e.g. glue work)?
- → Expand capacity (e.g. summarization for scanning)?
- →Add a new activity (e.g. new way to brainstorm)?

What is the level of **oversight** necessary?

- →Converting data formats vs. generating an article summary
- →Time needed for this oversight?

What task would it be used for?

→Generate news angles from science papers, no personalization

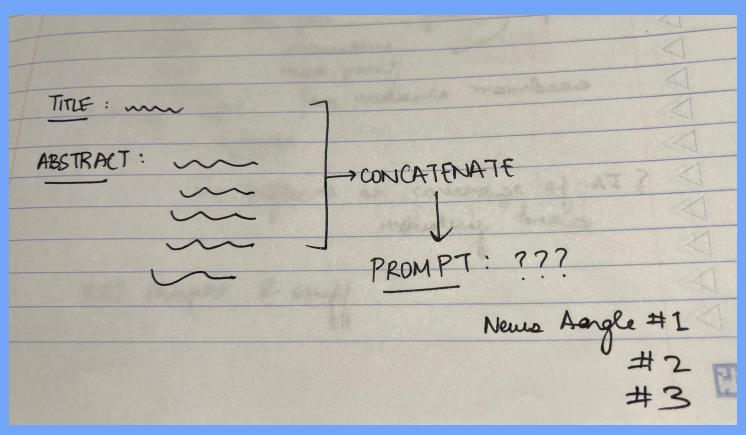

What is the **goal** for this task?

→Expand capacity, allow people to filter and brainstorm without getting bogged down by jargon

What is the level of **oversight** necessary?

→Not too much honestly, although factuality is a must or time is wasted

Old sketch from when I started doing this

Data **privacy** concerns, given this task + goal + oversight?

→Don't feed it personal/confidential data

What are the stakes if it makes an error? **Margin** for error?

- →C/f oversight that is needed + it will make errors, yes
- →Cost of false positives vs. false negatives?

What resources and training will you/users need?

→Startup resources vs. longer-term needs

Data **privacy** concerns, given this task + goal + oversight?

→Open-access, public data, not too worried about this

What are the stakes if it makes an error? **Margin** for error?

- →Wasted time with false positives how much?
- →Risk of missing out on important info how much?

What **resources and training** will you/users need?

- →Documentation around LLMs+how to use
- →Mechanisms to archive/bookmark things
- →Report errors and mistakes
- →Explanation???

Would you need a specialised **model training/tuning/interface**?

- → UI? Sheets? In CMS?
- → What other tech stack? Scraping?
- → Why not simpler, cheaper NLP?

Push vs. pull type of system?

→Who seeks out whom? Alignment to time?

Communicating <u>uncertainty</u> with system output?

→Do you need to do this? Where would it help?

Would you need a specialised **model training/tuning/interface**?

- →Fine-tuning because science is a specialized domain
- →Interface unnecessary, but allowed interoperability

Push vs. pull type of system?

→Pull system, unsure if reporters actually dig through individual preprints a lot

Communicating uncertainty with system output?

→Still very speculative when we were doing this, but if I were to do this again, I'd think about output probabilities for text

In Alexa, We Trust. Or Do We?: An analysis of People's Perception of Privacy Policies

Page 1 of 10

Date Published: Aug 31, 2022

Primary Category: Human-Computer Interaction

Potential news angles for framing this story:

- 1. Amazon's Alexa is Listening: Why You Should Be Concerned About Your Privacy
- 2. Amazon Alexa: Useful Tool or Big Brother in Disguise?
- 3. Is Amazon's Alexa Eavesdropping on Your Private Conversations?

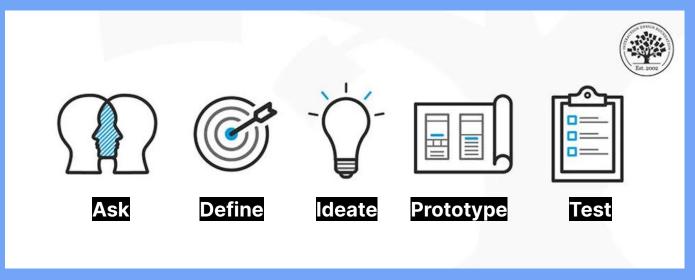

Abstract:

Smart home devices have found their way through people's homes as well as hearts. One such smart device is Amazon Alexa. Amazon Alexa is a voice-controlled application that is rapidly gaining popularity. Alexa was primarily used for checking weather forecasts, playing music, and controlling other devices. This paper tries to explore the extent to which people are aware of the privacy policies pertaining to the Amazon Alexa devices. We have evaluated behavioral change towards their interactions with the device post being aware of the adverse implications. Resulting knowledge will give researchers new avenues of research and interaction designers new insights into improving their systems.

So there's a hypothesis!

Source: Interaction Design Foundation (https://www.interaction-design.org/literature/article/5-stages-in-the-design-thinking-process)

Worth asking over the rest of the process

Conflict in <u>responsibilities</u> to audiences given the ethical positions and issues the profession navigates vs. GenAl <u>biases</u>/<u>inaccuracies</u>?

Is this actually going to **expand** capacity, or creativity, or speed? **Should** it?

How do you decide what projects to pursue?

We can do a thing. What uses are there for it?

We have a need. How can we address it?

Discuss and share

What's the value?

Source: RICE framework from Intercom

What's the value?

Reach × Impact × Confidence

RICER: Proposed framework for evaluating AI efforts

<u>R</u> each ×	How many people will this solution help?	Internal users End users
<u>I</u> mpact ×	How often and by how much?	Time saved New functionality enabled
<u>C</u> onfidence	How sure are we that	we can build it?the output will be of sufficient quality?people will use it?it will deliver the expected benefit?

Effort

×

Risk

How much time/expense will it take to...

...build it?

...maintain it?

...train the model and oversee the output?

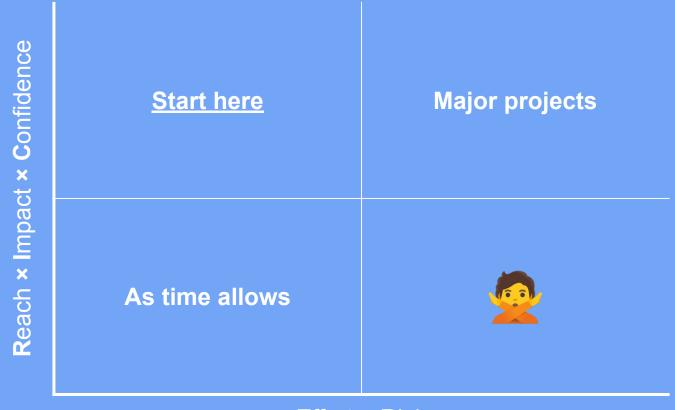

If something goes wrong, what is the potential harm to...

...our reputation/brand? (internal + external)

...our security?

Let's try it out: Take your use case through these

<u>R</u> each ×	How many people will this solution help?	Internal users End users
<u>I</u> mpact ×	How often and by how much?	Time saved New functionality enabled
<u>C</u> onfidence	How sure are we that	we can build it?the output will be of sufficient quality?people will use it?it will deliver the expected benefit?
<u>E</u> ffort ×	How much time/expense will it take to	build it? maintain it? train the model and oversee the output?
<u>R</u> isk	If something goes wrong, what is the potential harm to	our reputation/brand? (internal + external)our security?

Effort × Risk
